

## SAP BW Data Source Enhancement

Venkata Chalapathi Challapalli  
Senior Software Engineer

[venkata.challapalli@accenture.com](mailto:venkata.challapalli@accenture.com)

# 1. Introduction

As we can read from <http://help.sap.com> SAP Business Information Warehouse provided pre-configured objects under collective term "Business Content" (BC). Business Content includes DataSources, InfoObjects, data targets, and InfoSources that support the entire flow of data within BW. It provides a rapid starting point when modeling key business information requirements, and it is also intended to cover most of the traditional reporting requirements that companies face. However, Business Content will not solve all your data information needs.

Now the spontaneous question is: what's happen if a standard Business Content DataSource as provided in standard (ready-to-use) configuration doesn't completely meet our data model requirements?

In other words, we go in *RSA5* transaction screen (*Installation of DataSource from Business Content*), by surfing through application component hierarchy, we find our candidate DataSource *0FI\_GL\_4*; afterwards, a double-click on it and we inspect the field list - I don't see a specific needed field (e.g., BKTXT, the document header text) ! What I have to do?

## 2. Activities to perform in the R/3 Source System

### 2.1. Edit Standard DataSource

The first step is to enhance the DataSource for General Ledger: Line Items with Delta Extraction (*0FI\_GL\_4*) by adding the field Document Header Text (BKTXT). Go to transaction code: *RSA6* in the SAP R/3 source system. By surfing through application hierarchy, we find our candidate datasource *0FI\_GL\_4* as shown in Fig:1;

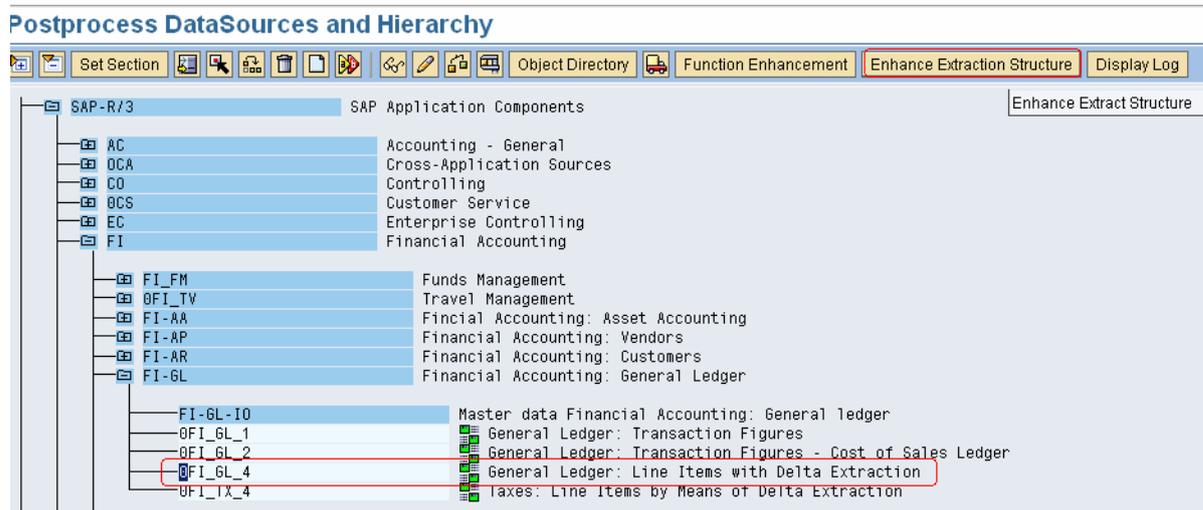

Fig:1 Selection of DataSource

Afterwards, select on it and display the datasource as shown in Fig:2.

## DataSource: Customer version Display

**Header Data**

DataSource: 0FI\_GL\_4 Package:

Description: General Ledger: Line Items with Delta Extraction

---

**Extraction**

ExtractStruct.: DTFIGL\_4

Direct Access: D

Delta Update:  DataSource for Reconciliation:

Field Name	Short text	Selection	Hide field	Inversion	Field only...
ANLN1	Main Asset Number	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Fig:2 Display DataSource: 0FI\_GL\_4

Double click on Extract Structure: DTFIGL\_4 and click on Append Structure button as shown in Fig:3

## Dictionary: Display Structure

Structure: DTFIGL\_4 Active Append Structure... (F5)

Short Text: Extract Structure: General Ledger Line Items to BW

Attributes Components Entry help/check Currency/quantity fields

Predefined Type 1 / 92

Component	RT...	Component type	Data Type	Length	Deci...	Short Text
BUKRS	<input type="checkbox"/>	BUKRS	CHAR	4	0	Company Code
FISCPER	<input type="checkbox"/>	RSFISCPER	NUMC	7	0	Fiscal year / period
BELNR	<input type="checkbox"/>	BELNR BIW	CHAR	10	0	Accounting Document Number

Fig:3 Display Extract Structure: DTFIGL\_4 and click on Append Structure button.

Add the field Document Header Text (ZZBKTXT) in the Append Structure with Component Type: BKTXT as shown in the Fig:4. Before you exit, make sure that you activate the structure by clicking on the activate button.

## Dictionary: Display Append Structure

Append Structure: ZADTFIGL\_4 Active

Short Text: Enhancement for CR-883

Attributes Components Entry help/check Currency/quantity fields

Predefined Type Show Appending Obj 1 / 1

Component	RT...	Component type	Data Type	Length	Deci...	Short Text
ZZBKTXT	<input type="checkbox"/>	BKTXI	CHAR	25	0	Document Header Text

Fig:4 Adding the field ZZBKTXT to Append Structure: ZADTFIGL\_4

You need to confirm that the Document Header Text(ZZBKTXT) has been added to the DataSource and that it will be available to BW. When you arrive back at the Postprocess Datasource and Hierarchy screen, select the same DataSource again and press the Change DataSource button .

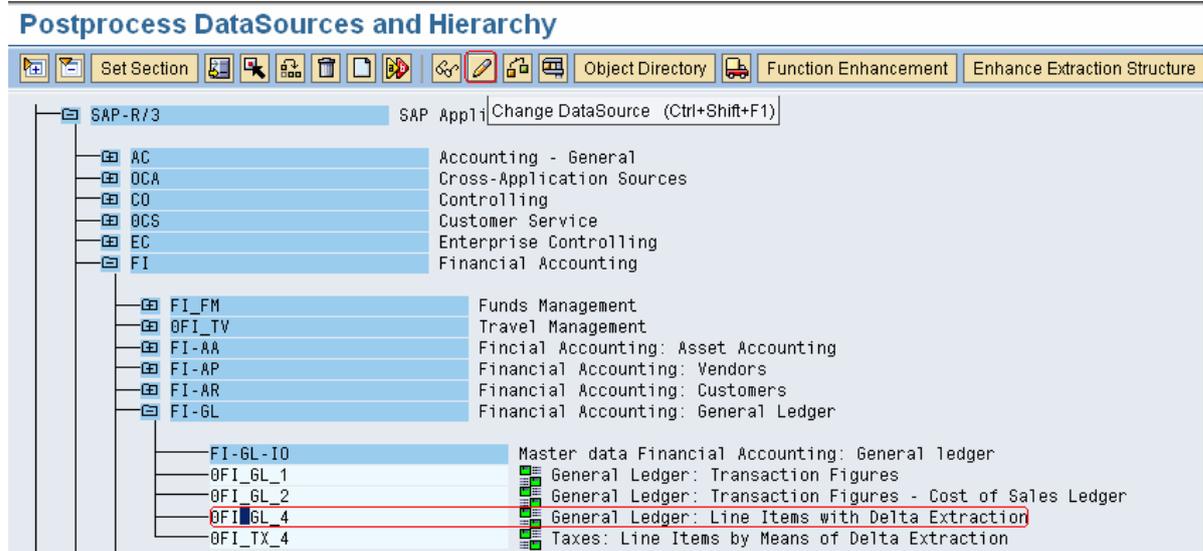

Fig:5 Click on Enhance Extraction Structure button

Scroll down to the bottom and you'll see the field has been successfully added to the extract structure. However, the Hide field will most likely be selected. To make this field available to the BW transfer structure, this field needs to be unchecked. Deselect the indicator and press the Save button. Before you exit the screen, be sure to notice the extract structure that the DataSource uses (Figure 6). This structure (DTFIGL\_4) will be needed in the next step.

## DataSource: Customer version Display

Header Data					
DataSource	0FI_GL_4	Package			
Description	General Ledger: Line Items with Delta Extraction				
Extraction					
ExtractStruct.	DTFIGL_4				
Direct Access	D				
Delta Update	<input checked="" type="checkbox"/>	DataSource for Reconciliation	<input type="checkbox"/>		
Field Name	Short text	Selection	Hide field	Inversion	Field only...
ZUONR	Assignment number	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
ZZBKTXT	Document Header Text	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Fig: 6 Deselected Hide Field of ZZBKTXT

At this point, the DataSource has been successfully enhanced. To be more specific, the extract structure that the DataSource uses to pass data to BW has been physically extended with the Document Header Text field found in the *Accounting Document Header* table:

BKPF. However, the data for the Document Header Text will not immediately be available to BW until you use an SAP enhancement to properly fill the DataSource with the values from this table, which is the next step.

## 2.2. *Populate the Extract Structure with Data*

SAP provides enhancement RSAP0001 that you use to populate the extract structure. This enhancement has four components that are specific to each of the four types of R/3 DataSources:

- Transaction data                   EXIT\_SAPLRSAP\_001
- Master data attributes            EXIT\_SAPLRSAP\_002
- Master data texts                 EXIT\_SAPLRSAP\_003
- Master data hierarchies         EXIT\_SAPLRSAP\_004

With these four components (they're actually four different function modules), any R/3 DataSource can be enhanced. In this case, you are enhancing a transaction data DataSource, so you only need one of the four function modules. Since this step requires ABAP development, it is best handled by someone on your technical team. You might need to provide your ABAP colleague with this information:

- The name of the DataSource (OFI\_GL\_4)
- The name of the extract structure (DTFIGL\_4)
- The name of the field that was added to the structure (ZZBKTXT)
- The name of the BW InfoSource (OFI\_GL\_4)
- The name of the R/3 table and field that contains the data you need (BKPF-BKTXT)

With this information, an experienced ABAP developer should be able to properly code the enhancement so that the extract structure is populated correctly. The ABAP code itself would look similar to that shown in Figure 7.

```
DATA: l_s_dtfigl_4 LIKE dtfigl_4.
CASE i_datasource.
  WHEN 'OFI_GL_4'.
    LOOP AT c_t_data INTO l_s_dtfigl_4.
      l_tabix = sy-tabix.
      SELECT SINGLE bktxt FROM bkpf INTO l_s_dtfigl_4-zzbktxt
      WHERE bukrs = l_s_dtfigl_4-bukrs
      AND   belnr = l_s_dtfigl_4-belnr
      AND   gjahr = l_s_dtfigl_4-fiscper+0(4).
      MODIFY c_t_data FROM l_s_dtfigl_4 INDEX l_tabix.
    ENLOOP .
  WHEN OTHERS.
    EXIT.
ENDCASE.
```

Fig:7 ABAP Code to populate extract structure in R/3 of transaction code: CMOD

## 2.3. *Check the DataSource in Extract Checker – RSA3*

The enhanced field can be validated /checked in the transaction code: RSA3 by giving the datasource: OFI\_GL\_4 and click on extraction button at R/3 system.

### 3. Activities to perform in SAP BW system

#### 3.1. Replicate DataSource in BW System

To replicate datasource, log into your BW system and go to the Source Systems listing in the Administrator Workbench. Right-click on the appropriate source system and choose Replicate DataSources from the context menu as shown in Fig:8.

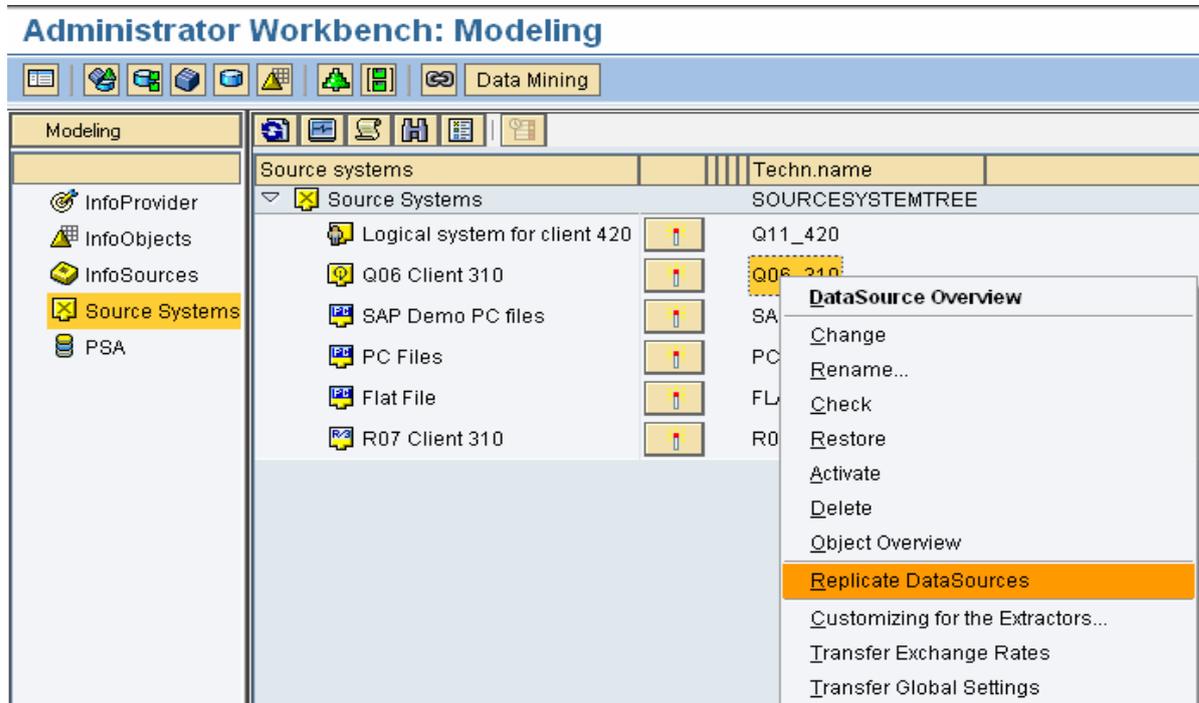

Fig:8 Replicate DataSource Screen in BW system of RSA1 transaction

#### 3.2. Create and assign InfoObject

We need to create a new InfoObject for the Document Header Text. To do so, go to transaction code RSD1, enter a name for the new InfoObject, and click on the Create button. You will then see a dialog window where you must enter a description for the new characteristic.

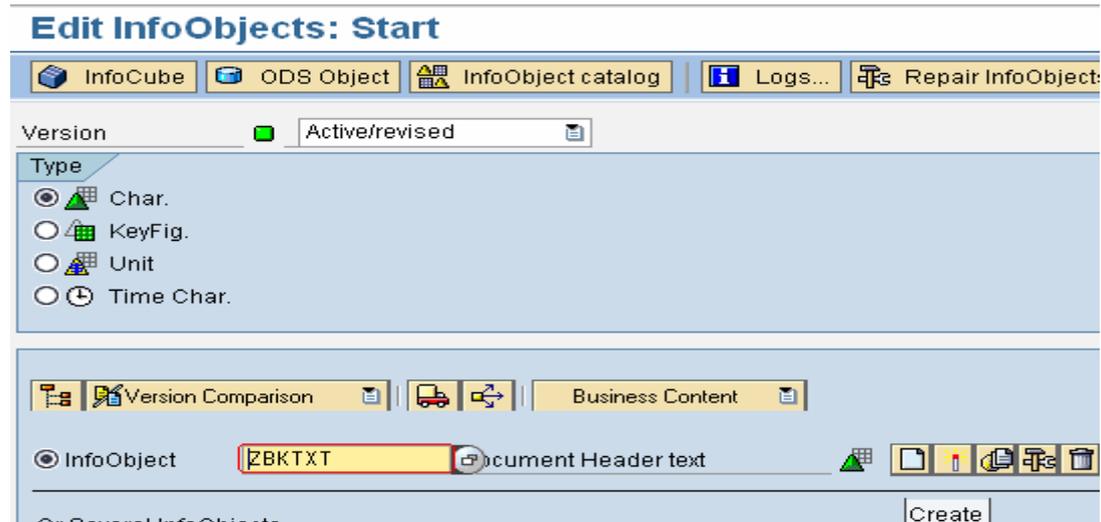

Fig:9 Create InfoObject:ZBKTXT

On the General tab, specify the data type and length of the characteristic as CHAR and 25, respectively, as shown in Figure 10. At the Master data/texts tab, specify that the

InfoObject will manage texts by clicking on With texts and Medium length texts exist. Finish creating this characteristic by clicking on the activate button and exiting the screen.

### Display Characteristic ZBKTXT: Detail

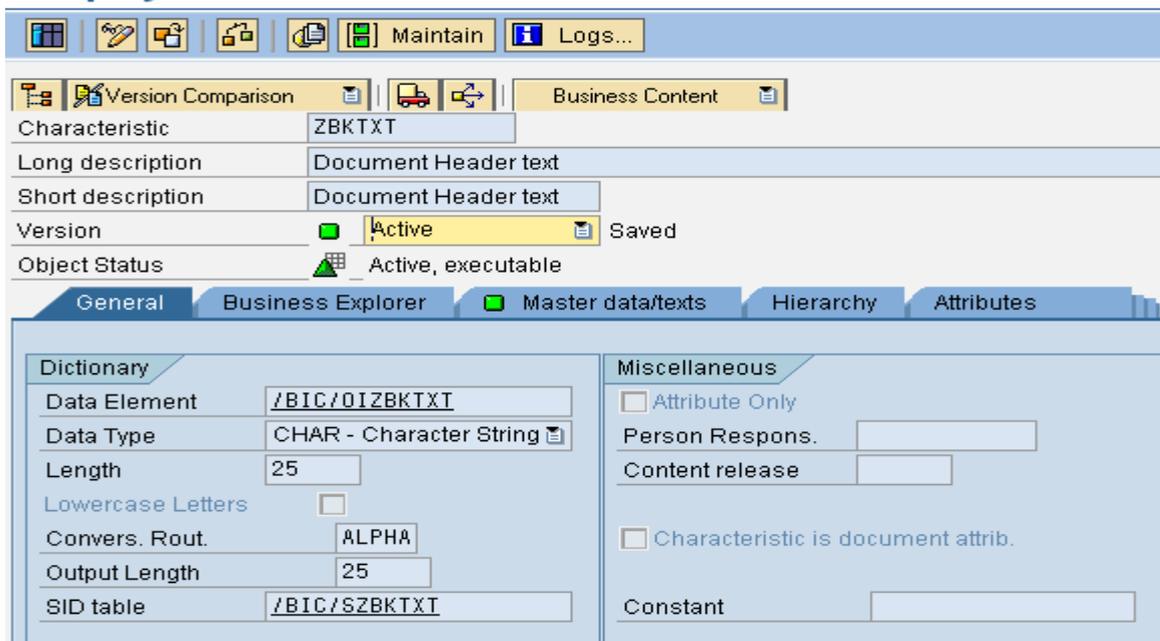

Fig:10 Characteristic InfoObject: ZBKTXT screen

### 3.3. Update the Transfer Rules

The next step is to maintain the transfer rules in order to properly map the fields from the DataSource to the communication structure of the InfoSource. In this example, you will be mapping them on a 1-to-1 basis from the DataSource field ZZBKTXT to the ZBKTXT InfoObject in the OFI\_GL\_4 InfoSource. Go to the listing of InfoSources and find the InfoSource for OFI\_GL\_4. Right-click on the source system ID and choose the Change Transfer Rules... option (Figure 11).

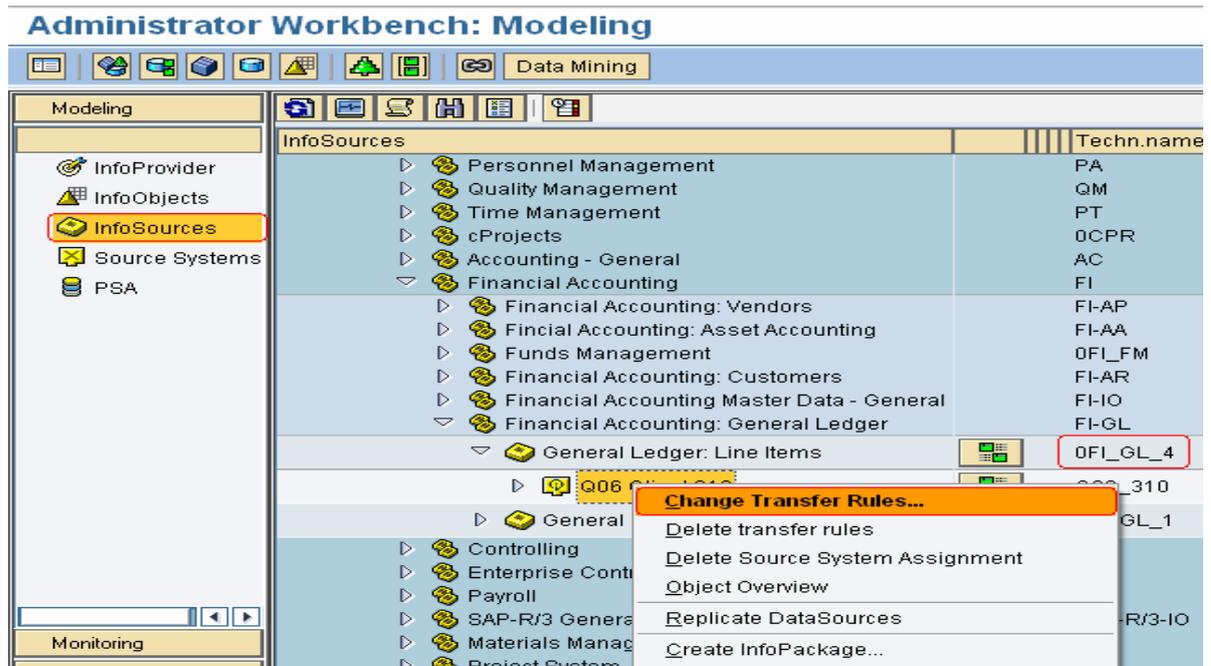

Fig:11 InfoSource: OFI\_GL\_4 in RSA1 transaction screen

When you first enter the next screen, Figure 12, you'll notice that the transfer rules are shown with a yellow light. Initially InfoObject in the Communication str./Transfer rules group (displayed in the lower-left corner) that doesn't have a mapping to a InfoObject from the Assign.InfoObjct-field group (displayed in the lower right corner) is ZBKTXT.

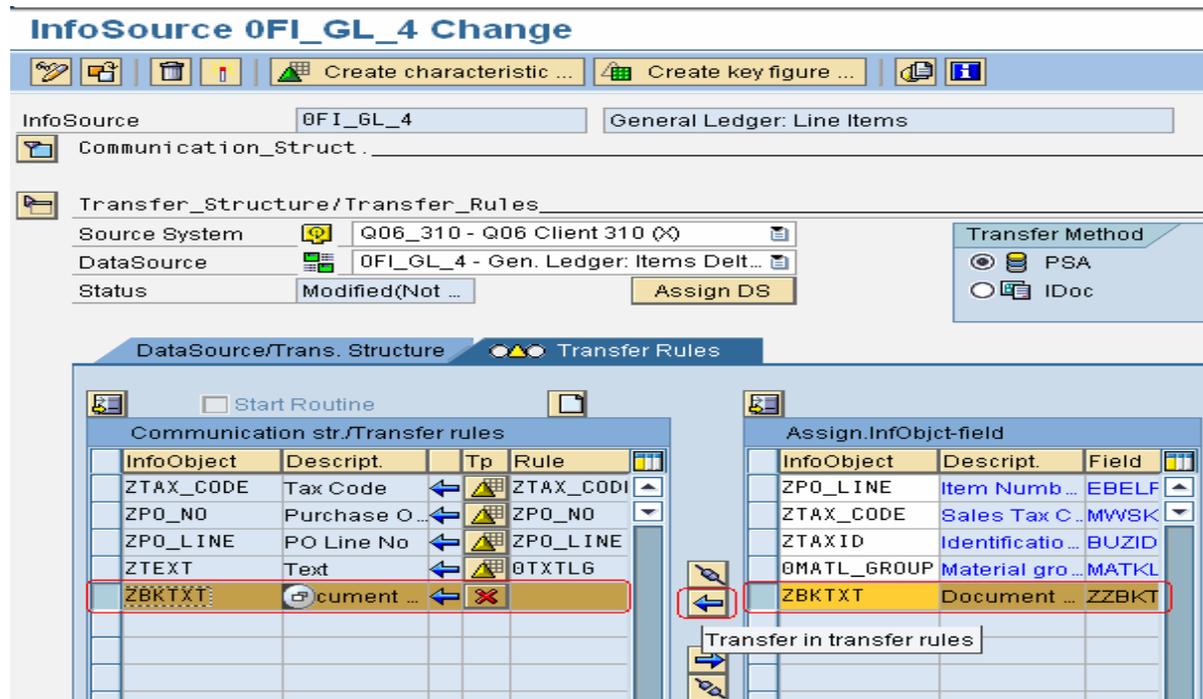

Fig:12 Transfer rules before mapping of InfoObject: ZBKTXT

In the Assign.InfoObjct-field window in the lower right of the screen, scroll to the bottom until you find the field ZZBKTXT. In the Communication str./Transfer rules group, select the InfoObject ZBKTXT as shown in Figure 12 and press the Transfer in transfer rules button. This maps the R/3 field ZZBKTXT to the characteristic **ZBKTXT**. At this point, you should see the Transfer Rules definition change to a green light. Activate the transfer rules by pressing the activate button and then exiting.

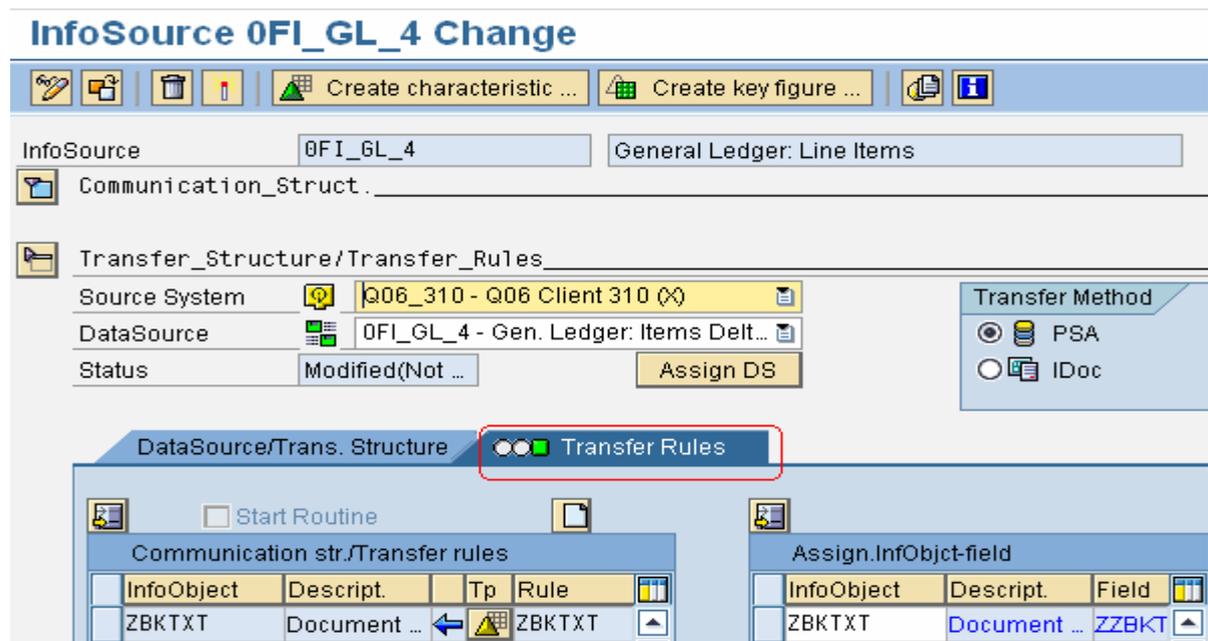

Fig:13 Transfer rules after mapping of InfoObject: ZBKTXT
